Facial Recognition: Privacy & Confidentiality Analysis

1. Identify an unfair/malicious use of these technologies, and give 2 arguments why you consider them unfair/malicious
2. Propose 2 actions to detect and control this unfair use, and if possible, to make it fair and harmless

Commercial Data Scraping: Companies scraping billions of photos from social media (without user consent) to build a searchable facial database sold to law enforcement.

Arguments:

- Security Risks: Unlike a password, you cannot change your face. If this centralized database is breached, the biometric data of millions is compromised forever.
- Repurposing Data: It violates the principle that data collected for one reason (social sharing with friends) should not be used for another (police investigations) without new consent.

Actions:

- Data Minimization Laws: Enforce strict adherence to privacy codes that require professionals to "minimize the data collected" and delete it once the original purpose is fulfilled.
- Poisoning Attacks: Users can employ "cloaking" tools (like Fawkes) that slightly alter the pixels in their photos, invisible to humans but confusing to AI, effectively "poisoning" the unauthorized database.
